Permissions in LINUX

When you do `ls -ltr` to list the files. You can see the permissions of the files.

drwxrwxrwx 1 root pool 256 Dec 10 18:49 File.txt

```
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:11 file2.txt
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$
```

d or - :- Generally the permissions of any file or folder starts with d or -. d is for directory and - is for a file. **user (first set of rwx)** – The user permissions apply only to the owner of the file or directory, they will not impact the actions of other users.

group(second set of rwx) – The group permissions apply only to the group that has been assigned to the file or directory, they will not affect the actions of other users.

others (third set of rwx) – The other permissions apply to all other users

on the system, this is the permission group that you want to watch the most.

"**chmod**" is the command to provide permission for file/directory.

chmod <permission_value> <file_name>

Read, write, execute and –

- The '**r**' means you can "read" the file's contents.
- The '**w**' means you can "write", or modify the file's contents.
- The '**x**' means you can "execute" the file. This permission is given only if the file is a program.
- If any of the "**rwX**" characters is replaced by a '**-**', then that permission has been revoked.
- If the permission is given as **777** as per the below mode, then the user will have full access to the folder or file. This is not advisable if the user is not a root user.

Symbolic	Mode	Absolute Mode
r	-read	4
w	-write	2
x	-execute	1
(-)	Null	0

```
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:11 file2.txt
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$ chmod 764 folder1
[ec2-user@ip-172-31-62-160 devops_day6]$ chmod 600 file1.txt
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw----- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:11 file2.txt
drwxrw-r-- 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$
```

OWNER OF THE FILE/DIRECTORY

In the above File.txt, **root** denotes the owner of the file. Generally, the default owner of the file is the user who creates it.

To change the ownership of a file/directory "**chown**" command is used.

chown **ownername:groupname** <folder/file>

```
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw----- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 ec2-user ec2-user 0 Mar 12 14:11 file2.txt
drwxrw-r-- 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$ sudo chown bandan:ec2-user fi
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw----- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 bandan    ec2-user 0 Mar 12 14:11 file2.txt
drwxrw-r-- 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$
```

GROUP OF THE FILE/DIRECTORY

In the above File.txt, **pool** is the group, the users belonging to this group will have relevant permissions to perform any action in the file/folder.

To change the group of the file/folder "**chgrp**" is used.

chgrp <new_group_name> <file/foldername>

```
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw----- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 bandan   ec2-user 0 Mar 12 14:11 file2.txt
drwxrw-r-- 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$ chgrp wheel folder2
[ec2-user@ip-172-31-62-160 devops_day6]$ ls -ltr
total 0
-rw----- 1 ec2-user ec2-user 0 Mar 12 14:10 file1.txt
-rw-rw-r-- 1 bandan   ec2-user 0 Mar 12 14:11 file2.txt
drwxrw-r-- 2 ec2-user ec2-user 6 Mar 12 14:11 folder1
drwxrwxr-x 2 ec2-user wheel    6 Mar 12 14:11 folder2
drwxrwxr-x 2 ec2-user ec2-user 6 Mar 12 14:11 demo
[ec2-user@ip-172-31-62-160 devops_day6]$
```

ACL

ACL stands for Access Control Lists.

Think of a scenario in which a particular user is not a member of group created by you but still you want to give some read or write access, how can you do it without making the user a member of the group, here comes in picture Access Control Lists, ACL helps us to do this trick.

ACLs are used to make a flexible permission mechanism in Linux.

getfacl is the command to show what are permission assigned to any file/folder.

setfacl is the command used to grant permission to any file/folder.

getfacl <file or foldername>

```
[ec2-user@ip-172-31-62-160 devops_day6]$ getfacl folder1
# file: folder1
# owner: ec2-user
# group: ec2-user
user::rwx
group::rw-
other::r--

[ec2-user@ip-172-31-62-160 devops_day6]$
```

setfacl -m "u:user:permissions" /path/to/file

setfacl -m "g:group:permissions" /path/to/file

```
[ec2-user@ip-172-31-62-160 devops_day6]$ getfacl folder1
# file: folder1
# owner: ec2-user
# group: ec2-user
user::rwx
group::rw-
other::r--

[ec2-user@ip-172-31-62-160 devops_day6]$ sudo setfacl -m "u:bandan:rwx"
[ec2-user@ip-172-31-62-160 devops_day6]$ getfacl folder1
# file: folder1
# owner: ec2-user
# group: ec2-user
user::rwx
user:bandan:rwx
group::rw-
mask::rwx
other::r--

[ec2-user@ip-172-31-62-160 devops_day6]$
```

```
[ec2-user@ip-172-31-62-160 devops_day6]$ getfacl folder1
# file: folder1
# owner: ec2-user
# group: ec2-user
user::rwx
user:bandan:rwx
group::rw-
mask::rwx
other::r--

[ec2-user@ip-172-31-62-160 devops_day6]$ sudo setfacl -m "g:wheel:rwx"
[ec2-user@ip-172-31-62-160 devops_day6]$ getfacl folder1
# file: folder1
# owner: ec2-user
# group: ec2-user
user::rwx
user:bandan:rwx
group::rw-
group:wheel:rwx
mask::rwx
other::r--

[ec2-user@ip-172-31-62-160 devops_day6]$
```
